                                                                                                                                                                                                 The present sequence is that of cDNA clone 1420940CB1 encoding human transferase TRNSFS-6 (see AAY79214), 1 of 15 claimed human transferase proteins of the invention (see AAY79209-23). The clone was isolated from foetal kidney cDNA library KIDNNOT09. TRNSFS-6 is expressed in cardiovascular, gastrointestinal, reproductive and endocrine tissues, especially those associated with cancer, inflammation and cell proliferation. It shows homology to ATP sulfurylase/APS kinase 2. A polynucleotide comprising nucleotides 942-986 of the present sequence can be used as a DNA probe. The
                                                                                                                                                                                                                                                                                                                                 new human transferase proteins and the polynucleotides encoding them can be used in the diagnosis, prevention and treatment (including gene therapy and antisense therapy) of cancer, developmental disorders, gastrointestinal disorders, genetic disorders, immunological disorders, neurological disorders, reproductive disorders, and smooth muscle disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 2617

The present sequence represents a human disease related nucleotide
Kinase-2 (DRNK-2) DNA sequence first identified in Incyte Clone
X13887 from the lung tissue colNA library (LUNGNOT 02). The DNKR-2 DNA
sequence is useful for the production of the corresponding recombinant
cenzyme. The invention provides DRNK enzymes, which are deoxyguanosine
Kinases, which catalyse the transfer of a terminal phosphate from
adenosine triphosphate (ATP) or guanine riphosphate (GTP) to guanosine
or guanidine in the regulation of cellular levels of GTP and its
corresponding nucleoside triphosphate. As GTP levels are known to
corresponding nucleoside triphosphate. As GTP levels are known to
corresponding nucleoside triphosphate. As GTP levels are known to
corresponding nucleoside triphosphate. As GTP levels are known to
corresponding nucleoside triphosphate. As GTP levels are known to
control the activity of certain oncogenic proteins oncogenesis.
Corresponding seases (e.g. cancers, immune disorders and neurological
dysfunction) related to this lack of activity may be prevented or
treated with the recombinant enzyme, or by gene therapy based strategies.
Anti-sense constructs of the DNKR encoding nucleic acids may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

```
This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AAX00602) for increasing the stability of the fused The invention relates to 87 novel genes and their fragments (nucleic acid sequences: AAX00611-X00724; amino acid sequences AAX0611-X00724; amino acid sequences AAX0611-X00724; amino acid sequences AAX061807-w68004) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 87 polynucleotides, based on which tissues they are most highly expressed in
  immune diseases, inflammation or blood disorders

```
generate fusion proteins by linking to the gene to a human immunoglobulin protein as compared to the human protein only.

The invention relates to 87 novel genes and their fragments (nucleic acid sequences: AAX00611-X00724; amino acid sequences AAX08011-X00724; amino acid sequences AAX08004) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypectides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 87 polynucleotides, based on which tissues they are most highly expressed in
                                                                                                                                                                                                                                                                                                                   94 GAGCAATAACGCGCAGAACTGGGGAATGCAGAGGCAACCAATGTCACCTACCAAGCCCA 153

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to the isolation of human polynucleotide sequences that are differentially expressed during foam cell differentiation. The polynucleotide sequences of the invention or a composition comprising these polynucleotides are useful as a high throughput method for detecting altered expression of one or more polynucleotides in a sample. The polynucleotides can be used in the diagnosis of disorders associated with foam cell development such as atheroscierosis, cerebral stroke, and cardiovascular disorders such as PCR primers and probes. The polynucleotide sequences can also be used as PCR primers and probes. The polynucleotides of the invention are als bolynucleotide sequences of the invention which are differentially expressed during foam cell differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    460 AGGTCTCAATAAAAATCTTGGCTTTAGTCCTGAAGACAGAGAAGAGAAATGTTCGACGCAT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   442
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  502
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  562
                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                and cell-cell
                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAT04849 and AAT04850 are fragments of the human adenosine 5' phosphosulphate kinase (5' PSK) of 990 and 600 bp respectively. They may be used as probes for the detection of genetic disease. The 990 bp fragment may also be used for low cost prodn. of human 5' PSK.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA fragment of human adenosine 5' phospho:sulphate kinase - used a probe in the detection of genetic disease and for the production of 5' phospho:sulphate kinase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        3;
                                                                                                                                                                                                                                                                                                                                                                                                                (SAMS) promoter fused to two soybean conditions are including and a second encoding cystathionine-gamma-synthase (CGSI) were inserted into binary vectors for Arabidopsis transformation. The SAMS promoter is active in seedlings and callus and over-expression of a gene in embryo stage can be achieved at an early developing stage using the SAMS promoter may be used as an alternative to cauliflower mosaic virus 35s promoter may be used as an alternative to cauliflower mosaic virus 35s promoter to drive expression of selectable marker genes. Plant cells transformed with the SAMS constitutive promoter are useful for increasing or decreasing the expression of heterologous nucleic acid fragments in a plant, preferably corn, rice, wheat, barley, safflower, cotton, tobacco, tomato, potato or cocoa. Target heterologous nucleic acid fragments include herbicide resistance or pathogen resistance nucleic acid fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        790

The present invention describes a library of polynucleotides comprising 1079 nucleotide sequences (given in AAH30067 to AAH3145). Also described are: (1) an isolated polynucleotide (1) having at least 90% identity to one of the 1079 sequences; (2) a recombinant host cell containing (1); cone of the 1079 sequences; (2) a recombinant host cell containing (1); (3) an isolated polypeptide (11) encoded by (1); (4) an antibody that specifically binds to (11); (5) a vector comprising (1); and (6) a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell comprising detecting a gene product encoded by 65 of the 1079 sequences given in the specification. The polynucleotides are used to monitor patients having (or susceptible) to cancer to detect potentially malignant events at a molecular level before they are detectable at a gross morphological level. The polynucleotides are also useful for monitoring the efficacy of various therapies and preventive interventions. Polynucleotide probes based on the disclosed sequences are useful for chromosome mapping and detection of transcription levels. The 1079 polynucleotide sequences were derived from a human colon cancer can
                                                                                                                                                                                                                                                           J, Innis MA, Garcia PD, Sudduth-Kling

```
The present invention describes a library of polynucleotides comprising are: (1) an isolated polynucleotide (1) having at least 90% identity to one of the 1079 sequences; (2) a recombinant host cell containing (1); (3) an isolated polypeptide (II) encoded by (I); (4) an antibody that specifically binds to (II); (5) a vector comprising (I); and (6) a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell comprising detecting a gene product encoded by 65 of the 1079 sequences given in the specification. The polynucleotides are used to monitor patients having (or susceptible) to cancer to detect containing a part used to monitor patients having (or susceptible) to cancer to detect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  interventions. Polynucleotide probes based on the disclosed sequences are useful for chromosome mapping and detection of transcription levels. The 1079 polynucleotide sequences were derived from a human colon cancer cell line Km12L4-A cDNA library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     potentially malignant events at a molecular level before they are detectable at a gross morphological level. The polynucleotides are also useful for monitoring the efficacy of various therapies and preventive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ĥ
